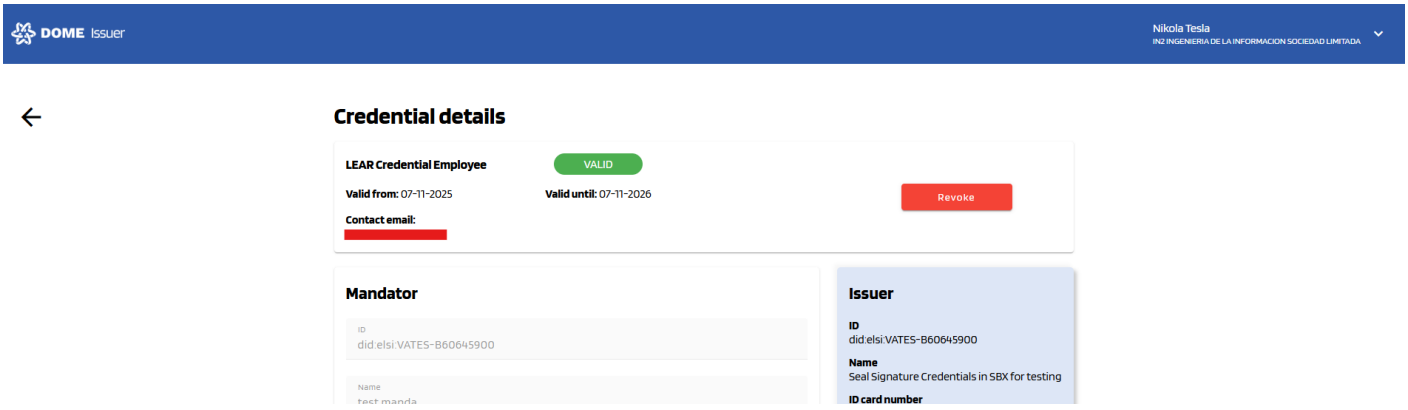
Credential Revocation

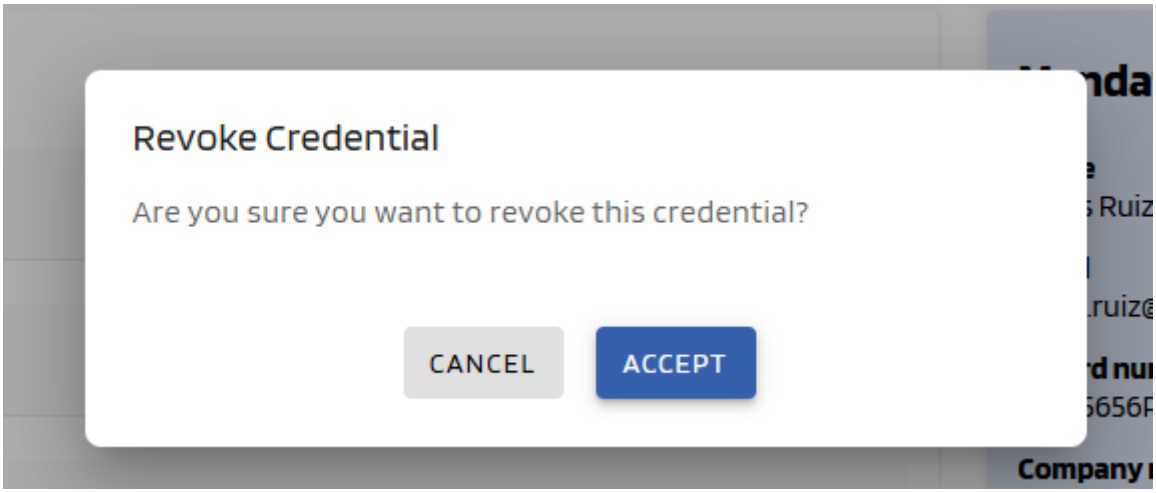
If you need to revoke a legacy credential, please see this section.

1. Revoke Credential (standard)

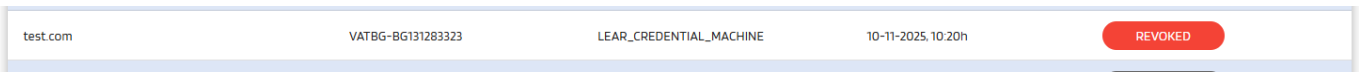
Once a user activates a credential, its status in the Issuer is set to **"VALID"**(see the *Credentials Management* article). A valid credential can be revoked, which means it will be effectively disabled and can no longer be used for authorization purposes.

To revoke a credential, simply click the **"Revoke"** button and confirm the action.

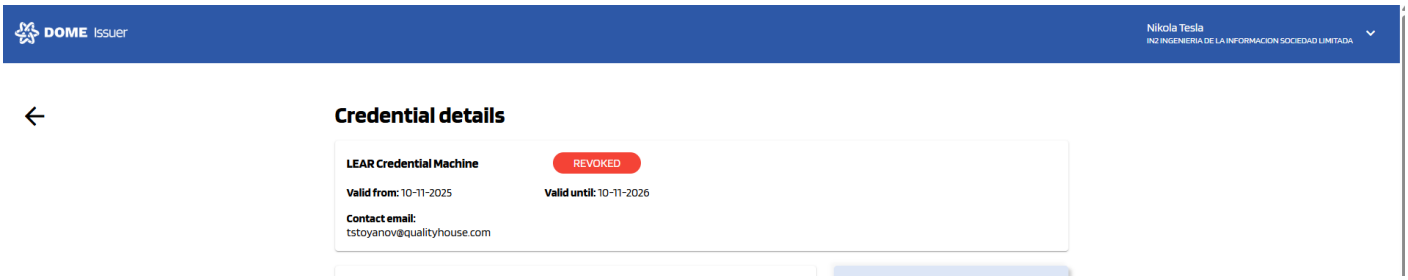




After confirmation, a success message will be displayed, and you will be redirected to the **credentials dashboard**, where the credential's status will now appear as **"REVOKED"**.

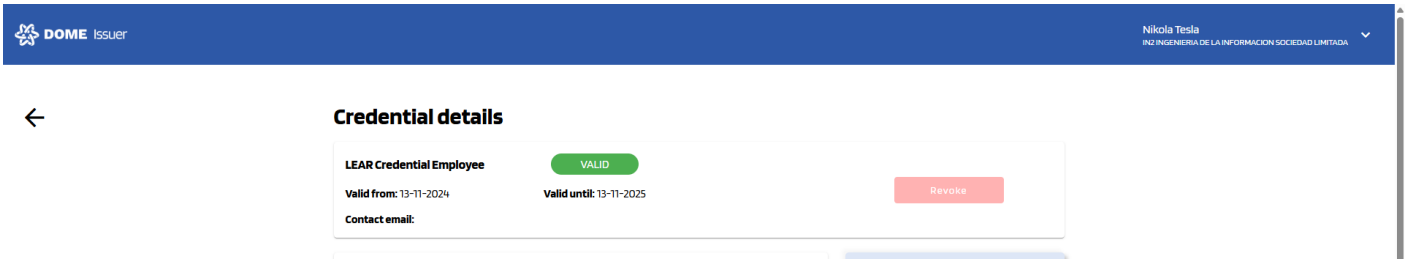


You can also verify the revocation on the **credential details page**.

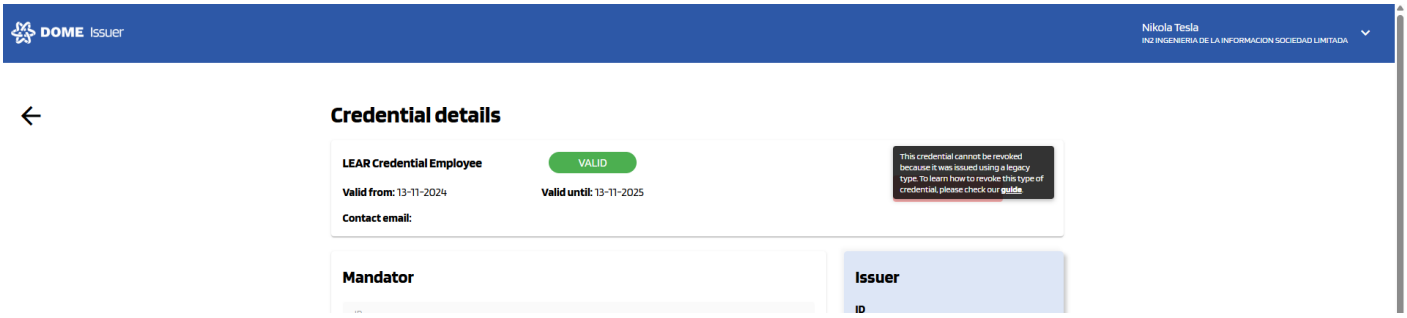


2. Revoke Legacy Credential

Old credentials can't be revoked in the way that has been explained in the previous section. Credentials of this type will have the "Revoke button" **disabled**.



When putting the mouse on it (or clicking on it), a tooltip message will be displayed with a link to the guide you are currently reading.



Legacy credentials must be manually added to the Revoked credentials list. Please check the Trust Framework guide to learn how to do so.
